

LM74670-Q1 Zero I_Q Smart Diode Rectifier Controller

1 Features

- AEC-Q100 Qualified With the Following Results:
 - Device Temperature Grade 1: -40°C to $+125^{\circ}\text{C}$ Ambient Operating Temperature Range
 - Exceeds HBM ESD Classification Level 2
 - Device CDM ESD Classification Level C4B
- Peak Input AC Voltage: 42 V
- Zero I_Q
- Charge Pump Gate Driver for external N-Channel MOSFET
- Low Forward-Voltage Drop and Less Power Dissipation Compared to Schottky Diode
- Capable of handling AC signal up to 300-Hz Frequency

2 Applications

- AC Rectifier
- Alternator
- Power Tools
- Reverse Polarity Protection

3 Description

The LM74670-Q1 is a controller device that can be used with an N-Channel MOSFET in full or half bridge rectifier architectures for alternators. It is designed to drive an external MOSFET to emulate an ideal diode. A unique advantage of this scheme is that it is not ground referenced, thus it has zero I_Q . The schottky diodes in full or half bridge rectifiers and alternators can be replaced with the LM74670-Q1 solution to avoid forward conduction diode losses and produce more efficient AC-DC converters.

The LM74670-Q1 controller provides a gate drive for external N-Channel MOSFET and a fast response internal comparator to pull-down the MOSFET Gate in the event of reverse polarity. This device can support an AC signal frequency up to 300Hz.

5 Pin Configuration and Functions

Pin Functions

PIN NO.	NAME	I/O	DESCRIPTION
1	VcapL		Charge Pump Output, connect to an external charge pump capacitor
2	Gate Pull Down		Connect to the gate of the external MOSFET for fast turn OFF in the case of reverse polarity
3	NC		No connect. Leave floating or connect to Anode pin
4	Anode		Anode of the diode, connect to source of the external MOSFET
5	NC		No connect. Leave floating or connect to gate drive pin
6	Gate Drive		Gate Drive output, Connect to the Gate of the external MOSFET
7	VcapH		Charge Pump Output, connect to an external charge pump capacitor
8	Cathode		Cathode of the diode, connect to Drain of the external MOSFET

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

	MIN	MAX	UNIT
Cathode to Anode (For a 2ms time duration) ^{(2), (3)}	-3	45	V
Cathode to Anode (Continuous) ⁽³⁾	-3	42	V
VcapH to VcapL	-0.3	7	V
Anode to VcapL	-0.3	3	V
Gate Drive, Gate Pull Down to VcapL	-0.3	7	V
Ambient Temperature (TA-MAX) ⁽⁴⁾	-40	125	°C
Case Temperature (TC-MAX)	-40	125	°C
Storage temperature range, T _{stg}	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) 42V continuous (and 45V transients for 2ms) absmax condition from Cathode to Anode. Suitable to use with TVS SMBJ28A and SMBJ14A at the anode.
- (3) Reverse voltage rating only. There is no positive voltage limitation for the LM74670-Q1 Anode terminal.
- (4) The device performance is ensured over this Ambient Temperature range as long the Case Temperature does not exceed the MAX value.

6.2 ESD Ratings

	VALUE	UNIT
V _(ESD) Electrostatic discharge ⁽¹⁾	Human body model (HBM), per AEC Q100-002 ⁽²⁾	±4000
	Charged-device model (CDM), per AEC Q100-011	±750

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.
- (2) The human body model is a 100 pF capacitor discharged through a 1.5 kΩ resistor into each pin.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	NOM	MAX	UNIT
Cathode To Anode			42	V
Ambient Temperature (TA-MAX)	-40		125	°C
Case Temperature (TC-MAX)			125	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		LM74670-Q1	UNIT
		DGK (VSSOP)	
		8 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	181	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	73	
R _{θJB}	Junction-to-board thermal resistance	102	
ψ _{JT}	Junction-to-top characterization parameter	11	
ψ _{JB}	Junction-to-board characterization parameter	100

7 Detailed Description

7.1 Overview

Using N-Channel MOSFETs with controller ICs can be highly effective and more efficient substitutes of lossy diodes in a bridge rectifier application. The LM74670-Q1 is designed to control a single N-Channel MOSFET in a full or half bridge rectifier as replacement for diode. In a full bridge rectifier, each diode can be replaced by the LM74670-Q1 and a MOSFET. Diodes used in bridge rectifiers cause high power losses associated with the forward voltage drop of each diode. In each cycle of sinusoidal AC voltage, two diodes conduct at the same time. Power losses during diode forward conduction increase as the output current increases. Diode rectification also increases peak current for applications that require high value output capacitance due to charge and discharge with the diode drop voltage. The ON state forward voltage loss in a MOSFET depends upon the $R_{DS(ON)}$ of the MOSFET. The power losses become substantially lower than diodes for the equivalent current. This solution has a small increase in complexity; however it eliminates the need for diode heatsinks and thermal management for high power AC bridge rectifier applications.

The LM74670-Q1 is a zero Iq controller that is combined with an external N-channel MOSFET to replace each diode in a bridge rectifier. The voltage across the MOSFET source and drain is constantly monitored by the LM74670-Q1 Anode and Cathode pins. An internal charge pump is used to provide the GATE drive for the external MOSFET. The forward conduction is through the MOSFET 98% of the time. The forward conduction is through the MOSFET body diode for 2% of time when energy is stored in an external charge pump capacitor Vcap [Figure 9](#). This stored energy is used to drive the gate of MOSFET. The voltage drop and power losses depend on the $R_{DS(ON)}$ of MOSFETs used to replace the rectifier diodes. The LM74670-Q1 has no ground reference which makes it identical to a diode.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 During T0

When power is initially applied, the load current (I_D) will flow through the body diode of the MOSFET and produce a voltage drop (V_f) during T0 in [Figure 8](#). This forward voltage drop (V_f) across the body diode of the MOSFET is used to charge up the charge pump capacitor Vcap. During this time, the charge pump capacitor Vcap is charged to a higher threshold of 6.3V (typical).

Feature Description (continued)

Figure 8. Output Voltage and V_{GS} Operation at 1A Output Current

7.3.2 During T1

Once the voltage on the capacitor reaches a higher voltage level of 6.3V (typical), the charge pump is disabled and the MOSFET turns ON. The energy stored in the capacitor is used to provide the gate drive for the MOSFET (T1 in [Figure 8](#)). When the MOSFET is ON, it provides a low resistive path for the drain current to flow and minimizes the power dissipation associated with forward conduction. The power losses during the MOSFET ON state depend primarily on the $R_{DS(on)}$ of the selected MOSFET and load current. At time when the capacitor voltage reaches its lower threshold V_{capL} 5.15V (typical), the MOSFET gate turns OFF. The drain current I_D will then begin to flow through the body diode of the MOSFET, causing the MOSFET body diode voltage drop to appear across Anode and Cathode pins. The charge pump circuitry is re-activated and begins charging the V_{cap} . The LM74670-Q1 operation keeps the MOSFET ON at approximately 98% duty cycle (typical) regardless of the external charge pump capacitor value. This is the key factor to minimizing the power losses. The forward voltage drop during this time is limited by the $R_{DS(on)}$ of the MOSFET.

7.3.3 Pin Operation

7.3.3.1 Anode and Cathode Pins

The LM74670-Q1 Anode and Cathode pins are connected to the source and drain of the external MOSFET. The current into the Anode pin is 30 μ A (typical). When power is initially applied, the load current flows through the body diode of the external MOSFET, the voltage across Anode and Cathode pins is equal to the forward diode drop. The minimum value of diode voltage drop required to enable the charge pump circuitry is 0.48V. Once the MOSFET is turned ON, the Anode and Cathode pins constantly sense the voltage difference across the MOSFET to determine the magnitude and polarity of the voltage across it. When the MOSFET is on, the voltage difference across Anode and Cathode pins depends on the $R_{DS(ON)}$ and load current. If voltage difference across source and drain of the external MOSFET becomes negative, this is sensed as a fault condition by Anode and Cathode pins and gate is turned off by Gate Pull Down pin as shown in [Figure 1](#). The reverse voltage threshold across Anode and Cathode to detect the fault condition is -20 mV. The consistent sensing of voltage polarity across the MOSFET enables the LM74670-Q1 to provide a fast response to the power source failure and limit the amount and duration of the reverse current flow.

7.3.3.2 VcapH and VcapL Pins

VcapH and VcapL are high and low voltage thresholds respectively that the LM74670-Q1 uses to detect when to turn the charge pump circuitry ON and OFF. The capacitor charging and discharging time can be correlated to the duty cycle of the MOSFET gate. Figure 9 shows the voltage behavior across the Vcap. During the time period T0, the capacitor is storing energy from the charge pump. The MOSFET is turned off and current flow is only through the body diode during this time period. The conduction through body diode of the MOSFET is for a

Feature Description (continued)

very small period of time (2% typical) which rules out the chances of overheating the MOSFET, regardless of the output current. Once the capacitor voltage reaches its high threshold, the MOSFET is turned off and charge pump circuitry is deactivated until the Vcap reaches its low voltage threshold (T1). The voltage difference between Vcap high and low threshold is typically 1.15V. The LM74670-Q1 charge pump has 46µA charging capability with 5-8MHz frequency.

Figure 9. Vcap Charging and Discarding by the Charge Pump

The Vcap current consumption is 0.95µA (typical) to drive the gate. The MOSFET OFF time (T0) and ON time (T1) can be calculated using the following expression

$$\Delta T = C \frac{dV}{dI} \quad (1)$$

Where:

- C = Vcap Capacitance
- dV = 1.15V
- dI = 46 µA for charging
- dI = 0.95 µA for discharging

Note: Temperature dependence of these parameters – The duty cycle is dependent on temperature since the capacitance variation over temperature has a direct correlation to the MOSFET OFF and ON periods and the frequency. If the capacitor varies 20% the periods and the frequency will also vary by 20% so it is recommended to use a quality X7R/COG cap and not to place the cap in close proximity to high temperature devices. The variation of the capacitor does not have a thermal impact in the application as the duty cycle does not change.

7.3.3.3 Gate Drive Pin

When the charge pump capacitor is charged to the high voltage level of 6.3V (typ), the Gate Drive pin provides a 67µA (typ) of drive current. When the charge pump capacitor reaches its lower voltage threshold of 5.15V (typ), Gate is pulled down to the Anode voltage (Vin). During the positive cycle of AC sinusoid, the MOSFET gate is turned ON by the LM74670-Q1 gate drive to ensure the forward conduction through the MOSFET.

7.3.3.4 Gate Pull Down Pin

The Gate Pull Down pin of the LM74670-Q1 is connected to the Gate Drive pin in a bridge rectifier application. When the controller detects negative polarity during the negative cycle of AC sinusoidal, the Pull-Down quickly discharges the MOSFET gate through a discharge transistor. This fast pull down reacts regardless of the Vcap charge level. When the negative voltage across the Anode and Cathode pins due to reverse current reaches -20mV (typical), the LM74670-Q1 immediately reacts and discharges the MOSFET gate capacitance as shown in [Figure 10](#). The Gate voltage is pulled down to Anode voltage with 160mA pull down current when the negative

Feature Description (continued)

cycle of the AC input starts. A MOSFET with 4nF of effective gate capacitance can be turned off by the LM74670-Q1 within 2.2μs (typical). The fast turnoff time minimizes the reverse current flow from MOSFET drain by opening the circuit. The reverse leakage current does not exceed 110μA for a constant 13.5V reverse voltage across Anode and Cathode pins. The reverse leakage current for a Schottky diode is 15mA under the same voltage and temperature conditions.

Figure 10. Gate Pull Down in the Event of Reverse Polarity

7.4 Device Functional Modes

The LM74670-Q1 operates in two modes:

- **Body Diode Conduction Mode**

The LM74670-Q1 solution works like a conventional diode during this time with higher forward voltage drop. The power dissipation during this time can be given as:

$$P_{\text{Dissipation}} = (V_{\text{Forward Drop}}) \times (I_{\text{Drain Current}}) \quad (2)$$

However, the current only flows through the body diode while the MOSFET gate is being charged to $V_{\text{GS(TH)}}$. This conduction is only for 2% duty cycle, therefore it does not cause any thermal issues.

$$\text{Body Diode ON Time} = \frac{C \times (V_{\text{capH}} - V_{\text{capL}})}{I_{\text{Charge Current}}} \quad (3)$$

- **The MOSFET Conduction Mode**

The MOSFET is turned on during this time and current flow is only through the MOSFET. The forward voltage drop and power losses are limited by the $R_{\text{DS(on)}}$ of the specific MOSFET used in the solution. The LM74670-Q1 solution output is comprised of the MOSFET conduction mode for 98% of its duty cycle. This time period is given by the following expression:

$$\text{MOSFET ON Time} = \frac{C \times (V_{\text{capH}} - V_{\text{capL}})}{I_{\text{Discharge Current}}} \quad (4)$$

Device Functional Modes (continued)

7.4.1 Duty Cycle Calculation

The LM74670-Q1 has an operating duty cycle of 98% at 25 °C and >90% at 125 °C. The duty cycle doesn't depend on the V_{cap} capacitance value. However, the variation in capacitance value over temperature has direct correlation to the switching frequency between the MOSFET and body diode. If the capacitance value decreases, the charging and discharging time will also decrease, causing more frequent switching between body diode and the MOSFET condition. The following expression can be used to calculate the duty cycle of the LM74670-Q1:

$$\text{Duty Cycle (\%)} = \frac{(\text{MOSFET ON Time})}{(\text{MOSFET ON Time} + \text{Body Diode ON Time})} \times 100 \quad (5)$$

7.4.2 Startup Voltage

The LM74670-Q1 will not initiate the charge pump operation if a closed loop system is in standby mode or the drain current is smaller than 1mA (typical). This is due to a minimum body diode voltage requirement of the LM74670-Q1 controller. If the drain current is too small to produce a minimum voltage drop of 0.48V at 25°C, the charge pump circuitry will remain off and the MOSFET will act just like a diode. It is very important to know the body diode voltage parameter of a MOSFET before implementing it into the Smart Diode solution. Some N-channels MOSFETs have very low body diode voltage at higher temperature. This makes their drain current requirement higher to achieve 0.48V across the body diode in order to initiate the LM74670-Q1 controller at higher temperatures.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Typical Rectifier Application

The LM74670-Q1 can be used with appropriate N-channel MOSFET to replace a diode in a typical rectifier application. The rectifier could be industrial for a 12/24AC supply or an automotive rectifier for a single phase or three phase field winding controlled alternator. The schematic for a typical implementation is shown in [Figure 11](#) to implement a full bridge rectifier. The same schematic can also be extended to six legs for a three phase alternator rectification. Following considerations need to be made when selecting the appropriate MOSFET for this application:

1. An input voltage of 24V AC can reach a 34V peak. The MOSFET selected should have a V_{DS} greater than this voltage.
2. The Continuous drain current of the MOSFET should be nearly $2.5X I_{AVG}$ to cover peak currents during rectification.
3. The $V_{GS(TH)}$ threshold voltage of the selected MOSFET should be $\leq 3V$ to ensure error-free operation.

Figure 11. Typical Full Bridge Rectifier Application

Typical Rectifier Application (continued)

8.1.1 Design Requirements

For this design example, use the parameters listed in [Table 1](#) as the input parameters

Table 1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input Voltage Range	4 – 42V peak AC
Output Voltage	rectified positive amplitude
Output current range	Maximum Drain current of MOSFET
Threshold voltage of FET $V_{GS(TH)}$	3V Max
Vcap value	1 μ F

8.1.2 Detailed Design Procedure

To begin the design process, determine the following:

8.1.2.1 Design Considerations

- Input voltage range
- Output current range
- Body Diode forward voltage drop for the selected MOSFET
- MOSFET Gate threshold voltage

8.1.2.2 Capacitor Selection

A ceramic capacitor should be placed between VcapL and VcapH. The capacitor acts as a holding tank to power up the control circuitry when the MOSFET is on.

When the MOSFET is off, this capacitor is charged up to higher voltage threshold of ~6.3V. Once this voltage is reached, the Gate Drive of LM74670-Q1 will provide drive for the external MOSFET. When the MOSFET is ON, the voltage across its body diode is collapsed because the forward conduction is through the MOSFET. During this time, the capacitor acts as a supply for the Gate Drive to keep the MOSFET ON.

The capacitor voltage will gradually decay when the MOSFET is ON. Once the capacitor voltage reaches a lower voltage threshold of 5.15V, the MOSFET is turned off and the capacitor gets recharged again for the next cycle.

A capacitor value of 220nF to 2.2 μ F with X7R/COG characteristic and 16V rating or higher is recommended for this application. A higher value capacitor sets longer MOSFET ON time and OFF time; however, the duty cycle remains at ~98% for MOSFET ON time irrespective of capacitor value.

If the Vcap value is 1 μ F, the MOSFET ON time and OFF time can be calculated using [Equation 1](#) :

$$\text{MOSFET ON Time} = (1\mu\text{F} \times 1.15\text{V})/0.95\mu\text{A} = 1.21 \text{ seconds} \quad (6)$$

$$\text{Body Diode ON Time} = (1\mu\text{F} \times 1.15\text{V})/46\mu\text{A} = 25 \text{ milliseconds} \quad (7)$$

The duty cycle can be calculated using [Equation 5](#) :

$$\text{Duty Cycle \%} = 1.21 \text{ sec} / (1.21 \text{ sec} + 0.025\text{sec}) = 98\% \quad (8)$$

8.1.2.3 MOSFET Selection

The important MOSFET electrical parameters are the maximum continuous Drain current I_D , the maximum drain-to-source voltage $V_{DS(MAX)}$, the gate-to-source threshold voltage $V_{GS(TH)}$ and the drain-to-source On resistance $R_{DS(ON)}$. The maximum continuous drain current, I_D , rating must exceed the maximum continuous load current. The rating for the maximum current through the body diode, I_S , is typically rated the same as, or slightly higher than the drain current, but body diode current only flows for a small period while the MOSFET gate is being charged to $V_{GS(TH)}$. The LM74670-Q1 can provide up to 5V V_{GS} to drive the external MOSFET, therefore the V_{GS} threshold of the selected MOSFET must be $\leq 3\text{V}$.

The voltage across the MOSFET's body diode must be higher than 0.48V at low current. The body diode voltage for MOSFETs typically decreases as the ambient temperature increases. This will increase the source current requirement to achieve the minimum body diode drain-to-source voltage for the charge pump to initiate. The maximum drain-to-source voltage, $V_{DS(MAX)}$, must be high enough to withstand the highest differential voltage seen in the application. This would include any anticipated fault conditions. Although there are no positive V_{DS} limitation. However, it is recommended to use MOSFETs with voltage rating up to 45V for automotive applications, since the LM74670-Q1 has a reverse voltage limit of -45V. Table 2 shows the examples of recommended MOSFETs to be used with the LM74670-Q1.

8.1.3 Application Curves

In the following plots, the input voltage is 20V AC. The output current is 5A for all frequencies.

Figure 12. Response to 60Hz AC Input

Figure 13. Response to 100Hz AC Input

Figure 14. Response to a 300Hz AC Input

8.2 Design Requirements

NOTE

Startup voltage is the voltage drop is needed for the controller to turn ON. It directly influences the Minimum output current at which the MOSFET turns ON.

(1) The LM74670-Q1 solution is not limited to the MOSFETs included in this table. It only shows examples of compatible MOSFETs.

9 Power Supply Recommendations

While testing the LM74670-Q1 solution, it is important to use low impedance power supply which allows current sinking. If the power supply does not allow current sinking, it would prevent the current flow in the reverse direction in the event of reverse polarity. The MOSFET gate won't get pulled down immediately due to the absence of reverse current flow.

10 Layout

10.1 Layout Guidelines

- The VIN terminal is recommended to have a low-ESR ceramic bypass-capacitor. The typical recommended bypass capacitance is a 10- μ F ceramic capacitor with a X5R or X7R dielectric.
- The VIN terminal must be tied to the source of the MOSFET using a thick trace or polygon.
- The Anode pin of the LM74670-Q1 is connected to the Source of the MOSFET for sensing.
- The Cathode pin of the LM74670-Q1 is connected to the drain of the MOSFET for sensing.
- The high current path of for this solution is through the MOSFET, therefor it is important to use thick traces for source and drain of the MOSFET.
- The charge pump capacitor Vcap must be kept away from the MOSFET to lower the thermal effects on the capacitance value.
- The Gate Drive and Gate pull down pins of the LM74670-Q1 must be connected to the MOSFET gate without using vias.
- Obtaining acceptable performance with alternate layout schemes is possible, however this layout has been shown to produce good results and is intended as a guideline.

11 Device and Documentation Support

11.1 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

11.2 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

11.3 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.4 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LM74670QDGKRQ1	ACTIVE	VSSOP	DGK	8	2500	Green (RoHS & no Sb/Br)	CU NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	ZGPK	Samples
LM74670QDGKTQ1	ACTIVE	VSSOP	DGK	8	250	Green (RoHS & no Sb/Br)	CU NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	ZGPK	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

DGK (S-PDSO-G8)

PLASTIC SMALL-OUTLINE PACKAGE

4073329/E 05/06

NOTES:

- A. All linear dimensions are in millimeters.
- B. This drawing is subject to change without notice.
- C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 per end.
- D. Body width does not include interlead flash. Interlead flash shall not exceed 0.50 per side.
- E. Falls within JEDEC MO-187 variation AA, except interlead flash.

DGK (S-PDSO-G8)

PLASTIC SMALL OUTLINE PACKAGE

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
